

ACCENTURE × SERVICENOW

HackNow

Business Solution Design Challenge

Twelve industries. Fifty real business problems. Design the end-to-end journey, the process, the roles and decisions, and the outcomes that prove it works.

50
CHALLENGE
STATEMENTS

Most sectors carry four challenge statements, with additional manufacturing, telecommunications, retail, IT, transportation, renewable energy and banking challenges. Pick one, design it end to end.

EDUCATIONAL INSTITUTE

Slides 3-6

Campus safety, hostel services, exams, lost & found

CHEMICAL INDUSTRY

Slides 11-14

Spill response, permit-to-work, SDS intelligence, near-miss

TELECOMMUNICATIONS

Slides 21-25

Outage, field service, SIM/device, network change, tiered customer care

HOTEL / HOSPITALITY

Slides 31-34

Guest concierge, VIP experience, room turnaround, root cause

HIRING / ONBOARDING / OFFBOARDING

Slides 40-43

New-hire readiness, interview-to-offer, offboarding, policy

RENEWABLE ENERGY & UTILITIES

Slides 49-50

Asset failure diagnosis, maintenance automation and performance insight

HOSPITALS / DAY-CARE

Slides 7-10

Discharge readiness, parent concerns, equipment, navigation

MANUFACTURING

Slides 15-20

Downtime, quality, knowledge, change risk, tooling and engineering requests

RETAIL

Slides 26-30

Store incidents, mall tenants, complaint recovery, opening readiness, society maintenance

IT INDUSTRY

Slides 35-39

War room, failure analysis, self-healing, tech debt, access governance

TRANSPORTATION & LOGISTICS

Slides 44-48

Shipment exceptions, driver safety, warehouse, documents, yard analytics

BANKING

Slides 51-52

Intelligent customer service, fraud and dispute management with SLA-driven routing

EDUCATIONAL INSTITUTE

BACKGROUND — PROBLEM

Universities receive fragmented complaints about unsafe classrooms, damaged lab equipment, furniture, leaks and electrical hazards. Safety-critical issues can be difficult to identify and prioritize.

- Handled today across multiple channels and manual steps, so the experience is inconsistent.
- Information is often incomplete or delayed when a decision has to be made.
- Teams need clearer ownership, status visibility and timely escalation.

HACKNOW DESIGN EXPECTATION

- Design the end-to-end business journey and user experience.
- Define the information, roles, decisions, approvals, actions and exceptions needed.
- Show how the process will be measured and how management will see outcomes.
- Participants decide the technology architecture and implementation approach.

OBJECTIVE — BUSINESS NEED

HACKNOW CHALLENGE: Design the end-to-end business solution, user journey, process, roles, decisions, exceptions and measurable outcomes.

ELEMENTS TO INCLUDE IN DESIGN

- Simple reporting experience for students/faculty
- Capture location, issue type, severity, description and evidence
- Prioritize safety-critical issues separately from routine maintenance
- Assign accountable facilities/security teams with clear due dates
- Escalate unresolved safety concerns
- Provide requester status and expected resolution
- Show recurring campus risks, hotspots and response KPIs
- Anonymous option should be available while reporting

EDUCATIONAL INSTITUTE

BACKGROUND — PROBLEM

Hostel teams handle plumbing, housekeeping, room changes, lost property, roommate concerns and emergency requests through disconnected channels.

- Handled today across multiple channels and manual steps, so the experience is inconsistent.
- Information is often incomplete or delayed when a decision has to be made.
- Teams need clearer ownership, status visibility and timely escalation.

OBJECTIVE — BUSINESS NEED

HACKNOW CHALLENGE: Design the end-to-end business solution, user journey, process, roles, decisions, exceptions and measurable outcomes.

ELEMENTS TO INCLUDE IN DESIGN

- Resident-facing request form covering room, housekeeping, plumbing, security and other concerns
- Capture building/room, urgency, description and supporting evidence
- Route requests according to concern type and urgency
- Provide clear ownership, status and expected response
- Handle sensitive or urgent matters through an appropriate escalation path
- Allow staff to record actions and resolution
- Report on recurring hostel issues and service performance

HACKNOW DESIGN EXPECTATION

- Design the end-to-end business journey and user experience.
- Define the information, roles, decisions, approvals, actions and exceptions needed.
- Show how the process will be measured and how management will see outcomes.
- Participants decide the technology architecture and implementation approach.

EDUCATIONAL INSTITUTE

BACKGROUND — PROBLEM

Students request missed-exam, timetable-conflict, attendance, re-evaluation and special-accommodation exceptions, creating significant manual review for examination committees.

- Handled today across multiple channels and manual steps, so the experience is inconsistent.
- Information is often incomplete or delayed when a decision has to be made.
- Teams need clearer ownership, status visibility and timely escalation.

OBJECTIVE — BUSINESS NEED

HACKNOW CHALLENGE: Design the end-to-end business solution, user journey, process, roles, decisions, exceptions and measurable outcomes.

ELEMENTS TO INCLUDE IN DESIGN

- Student-friendly exception request journey
- Capture academic context, reason, evidence and required supporting information
- Validate completeness before submission
- Apply consistent eligibility and decision criteria
- Support review, clarification, approval/rejection and appeal where applicable
- Provide transparent status and decision communication
- Measure turnaround time, exception volume and decision outcomes

HACKNOW DESIGN EXPECTATION

- Design the end-to-end business journey and user experience.
- Define the information, roles, decisions, approvals, actions and exceptions needed.
- Show how the process will be measured and how management will see outcomes.
- Participants decide the technology architecture and implementation approach.

EDUCATIONAL INSTITUTE

BACKGROUND — PROBLEM

Lost phones, laptops, IDs, bags and other belongings are reported separately from found items, making manual matching slow and unreliable.

- Handled today across multiple channels and manual steps, so the experience is inconsistent.
- Information is often incomplete or delayed when a decision must be made.
- Teams need clearer ownership, status visibility and timely escalation.
- Disposal of unclaimed items

OBJECTIVE — BUSINESS NEED

HACKNOW CHALLENGE: Design the end-to-end business solution, user journey, process, roles, decisions, exceptions and measurable outcomes.

ELEMENTS TO INCLUDE IN DESIGN

- Student/security reporting interface for lost and found items
- Capture detailed item description, location, time and identifying characteristics
- Allow found items to be registered with photographs/evidence
- Identify possible matches using available information
- Provide verification before handover
- Maintain custody and handover records
- Report on recovery rate, aging items and loss hotspots

HACKNOW DESIGN EXPECTATION

- Design the end-to-end business journey and user experience.
- Define the information, roles, decisions, approvals, actions and exceptions needed.
- Show how the process will be measured and how management will see outcomes.
- Participants decide the technology architecture and implementation approach.

HOSPITALS / DAY-CARE

BACKGROUND — PROBLEM

Patients may be medically ready to leave while operational blockers remain, such as documentation, billing clearance, transport, TPA approvals, instructions or equipment return.

- Handled today across multiple channels and manual steps, so the experience is inconsistent.
- Information is often incomplete or delayed when a decision has to be made.
- Teams need clearer ownership, status visibility and timely escalation.

OBJECTIVE — BUSINESS NEED

HACKNOW CHALLENGE: Design the end-to-end business solution, user journey, process, roles, decisions, notifications, exceptions and measurable outcomes.

ELEMENTS TO INCLUDE IN DESIGN

- Patient/caregiver view of discharge readiness
- Capture all outstanding discharge activities and dependencies
- Show a single readiness status with clear blockers
- Assign actions to responsible teams with target times
- Escalate blockers threatening planned discharge
- Provide completion confirmation and patient communication
- Measure discharge turnaround, blocker categories and delayed discharges

HACKNOW DESIGN EXPECTATION

- Design the end-to-end business journey and user experience.
- Define the information, roles, decisions, approvals, actions and exceptions needed.
- Show how the process will be measured and how management will see outcomes.
- Participants decide the technology architecture and implementation approach.

HOSPITALS / DAY-CARE

BACKGROUND — PROBLEM

Parents raise concerns about feeding, pickup delays, hygiene, belongings, classroom issues and incidents, with inconsistent triage and escalation.

- Handled today across multiple channels and manual steps, so the experience is inconsistent.
- Information is often incomplete or delayed when a decision has to be made.
- Teams need clearer ownership, status visibility and timely escalation.

OBJECTIVE — BUSINESS NEED

HACKNOW CHALLENGE: Design the end-to-end business solution, user journey, process, roles, decisions, exceptions and measurable outcomes.

ELEMENTS TO INCLUDE IN DESIGN

- Parent-facing concern submission and status experience
- Capture child, location, concern type, urgency and details
- Differentiate routine concerns from safety/welfare concerns
- Assign appropriate staff and escalation levels
- Record investigation, communication and resolution
- Provide parent status updates and closure confirmation
- Report on recurring concerns, response time and service quality
- Prioritize child safety and trigger escalations when requirements are not met

HACKNOW DESIGN EXPECTATION

- Design the end-to-end business journey and user experience.
- Define the information, roles, decisions, approvals, actions and exceptions needed.
- Show how the process will be measured and how management will see outcomes.
- Participants decide the technology architecture and implementation approach.

HOSPITALS / DAY-CARE

BACKGROUND — PROBLEM

Operational equipment may be unavailable, unclean, damaged or awaiting inspection before a procedure or day-care session.

- Handled today across multiple channels and manual steps, so the experience is inconsistent.
- Information is often incomplete or delayed when a decision has to be made.
- Teams need clearer ownership, status visibility and timely escalation.

OBJECTIVE — BUSINESS NEED

HACKNOW CHALLENGE: Design the end-to-end business solution, user journey, process, roles, decisions, exceptions and measurable outcomes.

ELEMENTS TO INCLUDE IN DESIGN

- Operational readiness checklist for critical equipment
- Capture equipment identity, location, condition and readiness status
- Record inspection results, defects and evidence
- Identify unavailable or unsafe equipment immediately
- Assign corrective actions and replacement/repair responsibilities
- Escalate unresolved critical equipment issues
- Track readiness percentage, downtime and recurring defects
- Track the complete lifecycle of equipment

HACKNOW DESIGN EXPECTATION

- Design the end-to-end business journey and user experience.
- Define the information, roles, decisions, approvals, actions and exceptions needed.
- Show how the process will be measured and how management will see outcomes.
- Participants decide the technology architecture and implementation approach.

HOSPITALS / DAY-CARE

BACKGROUND — PROBLEM

Large hospitals receive repetitive questions about locations, counters, documents, visiting hours and service procedures.

- Handled today across multiple channels and manual steps, so the experience is inconsistent.
- Information is often incomplete or delayed when a decision has to be made.
- Teams need clearer ownership, status visibility and timely escalation.

OBJECTIVE — BUSINESS NEED

HACKNOW CHALLENGE: Design the end-to-end business solution, user journey, process, roles, decisions, exceptions and measurable outcomes.

ELEMENTS TO INCLUDE IN DESIGN

- Visitor-friendly interface for common hospital questions
- Provide categorized information for locations, services, timings and procedures
- Support location-specific guidance where relevant
- Allow visitors to request additional help when self-service is insufficient
- Record unresolved questions for follow-up
- Provide clear directions and next steps
- Measure common enquiries, resolution rate and avoidable staff interactions
- Define and apply an escalation matrix

HACKNOW DESIGN EXPECTATION

- Design the end-to-end business journey and user experience.
- Define the information, roles, decisions, approvals, actions and exceptions needed.
- Show how the process will be measured and how management will see outcomes.
- Participants decide the technology architecture and implementation approach.

CHEMICAL INDUSTRY

BACKGROUND — PROBLEM

Chemical spills require immediate, structured response. Operators need to capture the chemical, location, quantity, exposure risk, people affected and required PPE.

- Handled today across multiple channels and manual steps, so the experience is inconsistent.
- Information is often incomplete or delayed when a decision has to be made.
- Teams need clearer ownership, status visibility and timely escalation.

OBJECTIVE — BUSINESS NEED

HACKNOW CHALLENGE: Design the end-to-end business solution, user journey, process, roles, decisions, exceptions and measurable outcomes.

ELEMENTS TO INCLUDE IN DESIGN

- Emergency reporting interface designed for rapid use
- Capture chemical, location, quantity, exposure and immediate actions
- Classify severity and potential impact
- Trigger a coordinated response sequence
- Assign responsibilities and record containment actions
- Escalate critical incidents and missed actions
- Track response, containment, exposure and corrective-action KPIs

HACKNOW DESIGN EXPECTATION

- Design the end-to-end business journey and user experience.
- Define the information, roles, decisions, approvals, actions and exceptions needed.
- Show how the process will be measured and how management will see outcomes.
- Participants decide the technology architecture and implementation approach.

CHEMICAL INDUSTRY

BACKGROUND — PROBLEM

Maintenance work around chemical equipment requires permits, hazard assessment, isolation, PPE and appropriate approvals.

- Handled today across multiple channels and manual steps, so the experience is inconsistent.
- Information is often incomplete or delayed when a decision has to be made.
- Teams need clearer ownership, status visibility and timely escalation.

OBJECTIVE — BUSINESS NEED

HACKNOW CHALLENGE: Design the end-to-end business solution, user journey, process, roles, decisions, exceptions and measurable outcomes.

ELEMENTS TO INCLUDE IN DESIGN

- Permit request journey with clear pre-work checks
- Capture work scope, location, hazards, controls and responsible personnel
- Validate mandatory safety information
- Support risk review and approval stages
- Prevent work from progressing when critical controls are incomplete
- Record exceptions and additional conditions
- Provide permit status, audit history and compliance reporting

HACKNOW DESIGN EXPECTATION

- Design the end-to-end business journey and user experience.
- Define the information, roles, decisions, approvals, actions and exceptions needed.
- Show how the process will be measured and how management will see outcomes.
- Participants decide the technology architecture and implementation approach.

CHEMICAL INDUSTRY

BACKGROUND — PROBLEM

Safety Data Sheets and technical documents contain critical information, but workers often struggle to find PPE, storage and exposure-response instructions quickly.

- Handled today across multiple channels and manual steps, so the experience is inconsistent.
- Information is often incomplete or delayed when a decision has to be made.
- Teams need clearer ownership, status visibility and timely escalation.

OBJECTIVE — BUSINESS NEED

HACKNOW CHALLENGE: Design the end-to-end business solution, user journey, process, roles, decisions, exceptions and measurable outcomes.

ELEMENTS TO INCLUDE IN DESIGN

- Employee-facing safety information search and guidance experience
- Allow users to locate approved information by chemical or task
- Present handling, storage, PPE and emergency information clearly
- Identify when information is unavailable or requires expert assistance
- Record useful feedback and unanswered questions
- Ensure information remains current and approved
- Measure search success, frequent topics and information gaps

HACKNOW DESIGN EXPECTATION

- Design the end-to-end business journey and user experience.
- Define the information, roles, decisions, approvals, actions and exceptions needed.
- Show how the process will be measured and how management will see outcomes.
- Participants decide the technology architecture and implementation approach.

CHEMICAL INDUSTRY

BACKGROUND — PROBLEM

Plants collect many near-miss reports, but recurring causes and patterns can remain hidden in free-text descriptions.

- Handled today across multiple channels and manual steps, so the experience is inconsistent.
- Information is often incomplete or delayed when a decision has to be made.
- Teams need clearer ownership, status visibility and timely escalation.

OBJECTIVE — BUSINESS NEED

HACKNOW CHALLENGE: Design the end-to-end business solution, user journey, process, roles, decisions, exceptions and measurable outcomes.

ELEMENTS TO INCLUDE IN DESIGN

- Near-miss reporting interface with structured and narrative input
- Capture location, activity, conditions, event description and potential consequence
- Allow evidence and witness information
- Classify causes and contributing conditions
- Support investigation and preventive action planning
- Track corrective actions to completion
- Measure repeat events, cause trends and prevention effectiveness

HACKNOW DESIGN EXPECTATION

- Design the end-to-end business journey and user experience.
- Define the information, roles, decisions, approvals, actions and exceptions needed.
- Show how the process will be measured and how management will see outcomes.
- Participants decide the technology architecture and implementation approach.

MANUFACTURING

BACKGROUND — PROBLEM

Production stoppages require operators and technicians to diagnose symptoms quickly, while historical failures and equipment knowledge may be scattered.

- Handled today across multiple channels and manual steps, so the experience is inconsistent.
- Information is often incomplete or delayed when a decision has to be made.
- Teams need clearer ownership, status visibility and timely escalation.

OBJECTIVE — BUSINESS NEED

HACKNOW CHALLENGE: Design the end-to-end business solution, user journey, process, roles, decisions, exceptions and measurable outcomes.

ELEMENTS TO INCLUDE IN DESIGN

- Capture machine, symptoms, production impact and urgency
- Provide symptom-based troubleshooting guidance
- Record actions, findings and recovery outcome
- Maintain ownership and continuity across shift handovers
- Notify supervisors when downtime exceeds defined thresholds
- Capture recurring equipment and failure patterns
- Show downtime details, trends and status in dashboards
- Measure downtime, recovery time and repeat failures

HACKNOW DESIGN EXPECTATION

- Design the end-to-end business journey and user experience.
- Define the information, roles, decisions, approvals, actions and exceptions needed.
- Show how the process will be measured and how management will see outcomes.
- Participants decide the technology architecture and implementation approach.

MANUFACTURING

BACKGROUND — PROBLEM

When a batch or production run fails quality checks, engineers must review test reports, document deviations, investigate causes and obtain approvals.

- Handled today across multiple channels and manual steps, so the experience is inconsistent.
- Information is often incomplete or delayed when a decision has to be made.
- Teams need clearer ownership, status visibility and timely escalation.

OBJECTIVE — BUSINESS NEED

HACKNOW CHALLENGE: Design the end-to-end business solution, user journey, process, roles, decisions, exceptions and measurable outcomes.

ELEMENTS TO INCLUDE IN DESIGN

- Capture product, batch, process, test results and evidence
- Validate required evidence before investigation
- Notify production to quarantine or hold flagged batches
- Support root-cause analysis and corrective actions
- Provide review and approval checkpoints
- Track overdue actions and recurring deviations
- Schedule a 30-day CAPA effectiveness review after closure
- Measure investigation time, trends and CAPA effectiveness

HACKNOW DESIGN EXPECTATION

- Design the end-to-end business journey and user experience.
- Define the information, roles, decisions, approvals, actions and exceptions needed.
- Show how the process will be measured and how management will see outcomes.
- Participants decide the technology architecture and implementation approach.

MANUFACTURING

BACKGROUND — PROBLEM

Technicians often need immediate guidance when a machine shows unfamiliar symptoms such as overheating, vibration or abnormal noise.

- Handled today across multiple channels and manual steps, so the experience is inconsistent.
- Information is often incomplete or delayed when a decision has to be made.
- Teams need clearer ownership, status visibility and timely escalation.

OBJECTIVE — BUSINESS NEED

HACKNOW CHALLENGE: Design the end-to-end business solution, user journey, process, roles, decisions, exceptions and measurable outcomes.

ELEMENTS TO INCLUDE IN DESIGN

- Provide a technician troubleshooting workspace
- Capture asset, symptoms, diagnostics and actions
- Surface relevant procedures and previous solutions
- Record successful and unsuccessful troubleshooting steps
- Escalate complex issues with full context
- Capture new findings before the case closes
- Require senior-technician approval before publication
- Measure first-time resolution, repair time and knowledge gaps

HACKNOW DESIGN EXPECTATION

- Design the end-to-end business journey and user experience.
- Define the information, roles, decisions, approvals, actions and exceptions needed.
- Show how the process will be measured and how management will see outcomes.
- Participants decide the technology architecture and implementation approach.

MANUFACTURING

BACKGROUND — PROBLEM

Changes to production processes or equipment can introduce quality, safety or downtime risks that are difficult to assess from the change request alone.

- Handled today across multiple channels and manual steps, so the experience is inconsistent.
- Information is often incomplete or delayed when a decision has to be made.
- Teams need clearer ownership, status visibility and timely escalation.

OBJECTIVE — BUSINESS NEED

HACKNOW CHALLENGE: Design the end-to-end business solution, user journey, process, roles, decisions, exceptions and measurable outcomes.

ELEMENTS TO INCLUDE IN DESIGN

- Capture the change, affected process, timing and impact
- Assess operational, quality and safety risks
- Enforce freeze windows; plant-manager approval for overrides
- Record contingency and rollback plans
- Auto-assign 48-hour operator verification at go-live
- Link downtime or deviations within 7 days to the change
- Escalate high-risk changes for appropriate review
- Measure success rate, incidents, rollbacks rate and review cycle time

HACKNOW DESIGN EXPECTATION

- Design the end-to-end business journey and user experience.
- Define the information, roles, decisions, approvals, actions and exceptions needed.
- Show how the process will be measured and how management will see outcomes.
- Participants decide the technology architecture and implementation approach.

MANUFACTURING

BACKGROUND — PROBLEM

Changes to production processes or equipment can introduce quality, safety or downtime risks that are difficult to assess from the change request alone.

- Handled today across multiple channels and manual steps, so the experience is inconsistent.
- Information is often incomplete or delayed when a decision has to be made.
- Teams need clearer ownership, status visibility and timely escalation.

OBJECTIVE — BUSINESS NEED

HACKNOW CHALLENGE: Design the end-to-end business solution, user journey, process, roles, decisions, exceptions and measurable outcomes.

ELEMENTS TO INCLUDE IN DESIGN

- Tool registry with usage tracking: cycle count, lifecycle limit and operator updates
- Configurable threshold alerts for inspection or replacement
- Technician-initiated inspections with structured condition assessment
- Reconditioning workflow with send-out tracking and return confirmation
- Mandatory re-certification before restored tools become available
- Block tools beyond lifecycle limits or with failed inspections
- Report tool utilization, failure rate and reconditioning cost by tool type

HACKNOW DESIGN EXPECTATION

- Design the end-to-end business journey and user experience.
- Define the information, roles, decisions, approvals, actions and exceptions needed.
- Show how the process will be measured and how management will see outcomes.
- Participants decide the technology architecture and implementation approach.

MANUFACTURING

BACKGROUND — PROBLEM

Changes to production processes or equipment can introduce quality, safety or downtime risks that are difficult to assess from the change request alone.

- Handled today across multiple channels and manual steps, so the experience is inconsistent.
- Information is often incomplete or delayed when a decision has to be made.
- Teams need clearer ownership, status visibility and timely escalation.

OBJECTIVE — BUSINESS NEED

HACKNOW CHALLENGE: Design the end-to-end business solution, user journey, process, roles, decisions, exceptions and measurable outcomes.

ELEMENTS TO INCLUDE IN DESIGN

- Structured change intake: product, process, reason, urgency and type
- Mandatory impact assessment: cost, lead time, quality and supplier dependency
- Sequential approvals: engineering, quality and production—with defined SLAs
- Rejection reasons and resubmission path; auto-cancel after 5 business days
- Auto-assign implementation tasks immediately after approval
- Require operator verification before the change record can close
- Dashboard change volume, cycle time, approval rate and rejection reasons

HACKNOW DESIGN EXPECTATION

- Design the end-to-end business journey and user experience.
- Define the information, roles, decisions, approvals, actions and exceptions needed.
- Show how the process will be measured and how management will see outcomes.
- Participants decide the technology architecture and implementation approach.

TELECOMMUNICATIONS

BACKGROUND — PROBLEM

Customers experiencing connectivity problems often raise individual cases even when many complaints relate to the same service or geographic event.

- Handled today across multiple channels and manual steps, so the experience is inconsistent.
- Information is often incomplete or delayed when a decision has to be made.
- Teams need clearer ownership, status visibility and timely escalation.

OBJECTIVE — BUSINESS NEED

HACKNOW CHALLENGE: Design the end-to-end business solution, user journey, process, roles, decisions, notifications, exceptions and measurable outcomes.

ELEMENTS TO INCLUDE IN DESIGN

- Customer-facing outage reporting and status experience
- Capture service issue, location and customer impact
- Group related reports into common service events
- Identify affected customers and service areas
- Provide consistent status communication and updates
- Track restoration and customer-impact milestones
- Measure duplicate cases, affected customers and recovery time

HACKNOW DESIGN EXPECTATION

- Design the end-to-end business journey and user experience.
- Define the information, roles, decisions, approvals, actions and exceptions needed.
- Show how the process will be measured and how management will see outcomes.
- Participants decide the technology architecture and implementation approach.

TELECOMMUNICATIONS

BACKGROUND — PROBLEM

Telecom field technicians need customer, service, equipment, history and troubleshooting information at the point of work.

- Handled today across multiple channels and manual steps, so the experience is inconsistent.
- Information is often incomplete or delayed when a decision has to be made.
- Teams need clearer ownership, status visibility and timely escalation.

OBJECTIVE — BUSINESS NEED

HACKNOW CHALLENGE: Design the end-to-end business solution, user journey, process, roles, decisions, exceptions and measurable outcomes.

ELEMENTS TO INCLUDE IN DESIGN

- Technician-facing work experience with customer/service context
- Present relevant job, location, history and troubleshooting information
- Capture diagnostics, work performed and outcome
- Support escalation without losing field context
- Capture parts/materials or follow-up requirements
- Provide customer completion confirmation
- Measure first-time fix, repeat visits and technician productivity

HACKNOW DESIGN EXPECTATION

- Design the end-to-end business journey and user experience.
- Define the information, roles, decisions, approvals, actions and exceptions needed.
- Show how the process will be measured and how management will see outcomes.
- Participants decide the technology architecture and implementation approach.

TELECOMMUNICATIONS

BACKGROUND — PROBLEM

Customers requesting replacement for damaged, lost or faulty devices need a consistent service journey with validation, approval and status tracking.

- Handled today across multiple channels and manual steps, so the experience is inconsistent.
- Information is often incomplete or delayed when a decision has to be made.
- Teams need clearer ownership, status visibility and timely escalation.

OBJECTIVE — BUSINESS NEED

HACKNOW CHALLENGE: Design the end-to-end business solution, user journey, process, roles, decisions, notification, exceptions and measurable outcomes.

ELEMENTS TO INCLUDE IN DESIGN

- Customer replacement request journey
- Capture customer, device/SIM, reason, verification and delivery details
- Validate eligibility and required information
- Support approval or exception handling
- Track replacement preparation and fulfillment stages
- Notify customer of progress and required actions
- Measure turnaround, rework, rejection and repeat replacement rates

HACKNOW DESIGN EXPECTATION

- Design the end-to-end business journey and user experience.
- Define the information, roles, decisions, approvals, actions and exceptions needed.
- Show how the process will be measured and how management will see outcomes.
- Participants decide the technology architecture and implementation approach.

TELECOMMUNICATIONS

BACKGROUND — PROBLEM

Network changes can create outages or customer impact, while approval teams may have limited visibility into historical failures and affected services.

- Handled today across multiple channels and manual steps, so the experience is inconsistent.
- Information is often incomplete or delayed when a decision has to be made.
- Teams need clearer ownership, status visibility and timely escalation.

OBJECTIVE — BUSINESS NEED

HACKNOW CHALLENGE: Design the end-to-end business solution, user journey, process, roles, decisions, exceptions and measurable outcomes.

ELEMENTS TO INCLUDE IN DESIGN

- Network-change assessment journey
- Capture scope, affected services, timing and implementation plan
- Identify potential customer and operational impact
- Support risk assessment and reviewer decision
- Record implementation, validation and rollback criteria
- Escalate high-impact or conflicting changes
- Measure change success, incidents and customer impact

HACKNOW DESIGN EXPECTATION

- Design the end-to-end business journey and user experience.
- Define the information, roles, decisions, approvals, actions and exceptions needed.
- Show how the process will be measured and how management will see outcomes.
- Participants decide the technology architecture and implementation approach.

TELECOMMUNICATIONS

BACKGROUND — PROBLEM

When customers report network outages, service degradation, billing issues, SIM/device replacement requests, or service modifications, support teams may lack real-time visibility into customer priority, service impact, entitlement levels and history of unresolved interactions.

- Manual triage can create inconsistent escalation, duplicate effort and missed SLA commitments.
- Gold customers require the highest-priority support, while Silver customers receive standard-priority support.

OBJECTIVE — BUSINESS NEED

HACKNOW CHALLENGE: Design a ServiceNow-powered telecom customer experience solution that differentiates support for Gold and Silver customers if they have at least one entitlement, through intelligent case management, proactive outage communication, routing, Customer 360 visibility and automated service workflows.

ELEMENTS TO INCLUDE IN DESIGN

- Identify customer tier and service entitlement
- Prioritize and route cases by business impact and customer value
- Provide proactive outage notifications and status updates
- Enable AI-driven self-service and intelligent case resolution
- Provide Customer 360 context for personalized support
- Use AI agents to diagnose issues and recommend resolutions
- Measure SLA compliance, resolution time, cost and satisfaction

HACKNOW DESIGN EXPECTATION

- Design the end-to-end business journey and user experience.
- Define the information, roles, decisions, approvals, actions and exceptions needed.
- Show how the process will be measured and how management will see outcomes.
- Participants decide the technology architecture and implementation approach.

RETAIL

BACKGROUND — PROBLEM

Store employees handle POS issues, refrigeration failures, security concerns, lighting problems and customer complaints through multiple channels.

- Handled today across multiple channels and manual steps, so the experience is inconsistent.
- Information is often incomplete or delayed when a decision has to be made.
- Teams need clearer ownership, status visibility and timely escalation.

OBJECTIVE — BUSINESS NEED

HACKNOW CHALLENGE: Design the end-to-end business solution, user journey, process, roles, decisions, exceptions and measurable outcomes.

ELEMENTS TO INCLUDE IN DESIGN

- Store employee issue reporting experience
- Capture store, issue category, severity, location and evidence
- Prioritize customer-facing and business-critical issues
- Route to the accountable operational team
- Provide status and escalation for overdue issues
- Capture resolution and repeat occurrence
- Show store-level trends, aging and response KPIs

HACKNOW DESIGN EXPECTATION

- Design the end-to-end business journey and user experience.
- Define the information, roles, decisions, approvals, actions and exceptions needed.
- Show how the process will be measured and how management will see outcomes.
- Participants decide the technology architecture and implementation approach.

RETAIL

BACKGROUND — PROBLEM

Mall tenants submit maintenance, access, loading dock, advertising, event and security requests, often requiring several approvals.

- Handled today across multiple channels and manual steps, so the experience is inconsistent.
- Information is often incomplete or delayed when a decision has to be made.
- Teams need clearer ownership, status visibility and timely escalation.

OBJECTIVE — BUSINESS NEED

HACKNOW CHALLENGE: Design the end-to-end business solution, user journey, process, roles, decisions, exceptions and measurable outcomes.

ELEMENTS TO INCLUDE IN DESIGN

- Tenant self-service request experience
- Capture tenant, request type, location, urgency and approvals
- Validate required documents and information
- Coordinate facilities, security, loading, events and other responsibilities
- Track approvals, work and completion
- Escalate delays affecting tenant operations
- Provide tenant and management visibility of status and SLA performance

HACKNOW DESIGN EXPECTATION

- Design the end-to-end business journey and user experience.
- Define the information, roles, decisions, approvals, actions and exceptions needed.
- Show how the process will be measured and how management will see outcomes.
- Participants decide the technology architecture and implementation approach.

RETAIL

BACKGROUND — PROBLEM

Customer complaints vary widely in severity and sentiment, making it difficult to consistently determine the right recovery action.

- Handled today across multiple channels and manual steps, so the experience is inconsistent.
- Information is often incomplete or delayed when a decision has to be made.
- Teams need clearer ownership, status visibility and timely escalation.

OBJECTIVE — BUSINESS NEED

HACKNOW CHALLENGE: Design the end-to-end business solution, user journey, process, roles, decisions, exceptions and measurable outcomes.

ELEMENTS TO INCLUDE IN DESIGN

- Customer complaint capture with consistent recovery handling
- Capture complaint, sentiment, impact, channel and customer history
- Classify severity and business risk
- Provide guided recovery decision points
- Escalate high-risk or sensitive complaints
- Capture resolution, customer response and follow-up
- Identify repeat complaint drivers and measure recovery effectiveness
- Track knowledge transfer and handover

HACKNOW DESIGN EXPECTATION

- Design the end-to-end business journey and user experience.
- Define the information, roles, decisions, approvals, actions and exceptions needed.
- Show how the process will be measured and how management will see outcomes.
- Participants decide the technology architecture and implementation approach.

RETAIL

BACKGROUND — PROBLEM

New store openings require hundreds of coordinated activities covering facilities, safety, signage, equipment, security, staff and inventory readiness.

- Handled today across multiple channels and manual steps, so the experience is inconsistent.
- Information is often incomplete or delayed when a decision has to be made.
- Teams need clearer ownership, status visibility and timely escalation.

OBJECTIVE — BUSINESS NEED

HACKNOW CHALLENGE: Design the end-to-end business solution, user journey, process, roles, decisions, exceptions and measurable outcomes.

ELEMENTS TO INCLUDE IN DESIGN

- Store-opening readiness experience
- Create readiness plan covering facilities, safety, staffing, equipment and operations
- Track dependencies and milestones
- Identify blockers and risks before opening
- Assign accountable owners and due dates
- Provide leadership readiness status and exception view
- Measure on-time readiness, blocker aging and launch issues

HACKNOW DESIGN EXPECTATION

- Design the end-to-end business journey and user experience.
- Define the information, roles, decisions, approvals, actions and exceptions needed.
- Show how the process will be measured and how management will see outcomes.
- Participants decide the technology architecture and implementation approach.

RETAIL

BACKGROUND — PROBLEM

Poor post-handover facility upkeep, slow response times, limited transparency between residents and facility managers, and frequent breakdowns often lead to reactive rather than preventive maintenance.

- Handled today across multiple channels and manual steps, so the experience is inconsistent.
- Information is often incomplete or delayed when a decision has to be made.
- Teams need clearer ownership, status visibility and timely escalation.

OBJECTIVE — BUSINESS NEED

HACKNOW CHALLENGE: Build a unified portal linking property residents, facility managers and technicians to automate complaint registration, ticket assignment and preventive asset servicing—with clear processes, roles, decisions, exceptions and measurable outcomes.

ELEMENTS TO INCLUDE IN DESIGN

- Multichannel complaint portal with photos, block/flat location and severity labels
- Automated categorization using simple NLP or rules for plumbing, electrical and security
- Real-time SLA countdown with color-coded priority and breach visibility
- Intelligent routing by technician skill, location and active workload
- Mobile technician view for assignments, work status and after-fix proof
- Maintenance ledger for dues, digital receipts and vendor-repair spending
- Dashboard resolution time, recurring failures and technician performance

HACKNOW DESIGN EXPECTATION

- Design the end-to-end business journey and user experience.
- Define the information, roles, decisions, approvals, actions and exceptions needed.
- Show how the process will be measured and how management will see outcomes.
- Participants decide the technology architecture and implementation approach.

HOTEL / HOSPITALITY

BACKGROUND — PROBLEM

Hotel guests ask repetitive questions about late checkout, spa locations, amenities, lost property and room issues, creating avoidable staff workload.

- Handled today across multiple channels and manual steps, so the experience is inconsistent.
- Information is often incomplete or delayed when a decision has to be made.
- Teams need clearer ownership, status visibility and timely escalation.

OBJECTIVE — BUSINESS NEED

HACKNOW CHALLENGE: Design the end-to-end business solution, user journey, process, roles, decisions, exceptions and measurable outcomes.

ELEMENTS TO INCLUDE IN DESIGN

- Guest-facing service request and information experience
- Provide easy access to common hotel information
- Allow guests to raise room/service requests with details and urgency
- Route requests to responsible hotel teams
- Provide progress updates and expected completion
- Escalate delayed or high-priority guest issues
- Measure request volume, response time and guest satisfaction

HACKNOW DESIGN EXPECTATION

- Design the end-to-end business journey and user experience.
- Define the information, roles, decisions, approvals, actions and exceptions needed.
- Show how the process will be measured and how management will see outcomes.
- Participants decide the technology architecture and implementation approach.

HOTEL / HOSPITALITY

BACKGROUND — PROBLEM

VIP arrivals require coordinated preparation across rooms, housekeeping, amenities, dining preferences and concierge activities.

- Handled today across multiple channels and manual steps, so the experience is inconsistent.
- Information is often incomplete or delayed when a decision has to be made.
- Teams need clearer ownership, status visibility and timely escalation.

OBJECTIVE — BUSINESS NEED

HACKNOW CHALLENGE: Design the end-to-end business solution, user journey, process, roles, decisions, exceptions and measurable outcomes.

ELEMENTS TO INCLUDE IN DESIGN

- VIP preparation checklist and coordination journey
- Capture guest preferences, special arrangements and arrival details
- Create accountable preparation activities across departments
- Track completion and exceptions before arrival
- Escalate missing critical arrangements
- Provide management readiness view
- Measure VIP readiness, missed preparations and guest-impacting exceptions

HACKNOW DESIGN EXPECTATION

- Design the end-to-end business journey and user experience.
- Define the information, roles, decisions, approvals, actions and exceptions needed.
- Show how the process will be measured and how management will see outcomes.
- Participants decide the technology architecture and implementation approach.

HOTEL / HOSPITALITY

BACKGROUND — PROBLEM

After checkout, rooms need housekeeping, inspection and readiness confirmation before the next guest arrives.

- Handled today across multiple channels and manual steps, so the experience is inconsistent.
- Information is often incomplete or delayed when a decision has to be made.
- Teams need clearer ownership, status visibility and timely escalation.

OBJECTIVE — BUSINESS NEED

HACKNOW CHALLENGE: Design the end-to-end business solution, user journey, process, roles, decisions, exceptions and measurable outcomes.

ELEMENTS TO INCLUDE IN DESIGN

- Housekeeping turnaround coordination experience
- Show rooms requiring preparation based on arrival priorities
- Capture cleaning, inspection and readiness status
- Identify blockers such as maintenance or missing items
- Escalate rooms at risk of late availability
- Provide front desk and housekeeping shared status
- Measure turnaround time, delayed rooms and bottlenecks

HACKNOW DESIGN EXPECTATION

- Design the end-to-end business journey and user experience.
- Define the information, roles, decisions, approvals, actions and exceptions needed.
- Show how the process will be measured and how management will see outcomes.
- Participants decide the technology architecture and implementation approach.

HOTEL / HOSPITALITY

BACKGROUND — PROBLEM

Hotels collect many complaints but may struggle to identify whether recurring issues originate from housekeeping, facilities, food service or front desk processes.

- Handled today across multiple channels and manual steps, so the experience is inconsistent.
- Information is often incomplete or delayed when a decision has to be made.
- Teams need clearer ownership, status visibility and timely escalation.

OBJECTIVE — BUSINESS NEED

HACKNOW CHALLENGE: Design the end-to-end business solution, user journey, process, roles, decisions, exceptions and measurable outcomes.

ELEMENTS TO INCLUDE IN DESIGN

- Guest complaint intake and improvement workflow
- Capture complaint category, location, service area and impact
- Identify repeat or systemic issues
- Assign immediate recovery and longer-term corrective actions
- Track customer communication and closure
- Escalate recurring high-impact issues
- Measure complaint recurrence, recovery time and satisfaction

HACKNOW DESIGN EXPECTATION

- Design the end-to-end business journey and user experience.
- Define the information, roles, decisions, approvals, actions and exceptions needed.
- Show how the process will be measured and how management will see outcomes.
- Participants decide the technology architecture and implementation approach.

IT INDUSTRY

BACKGROUND — PROBLEM

Critical incidents require rapid access to incident timelines, affected services, related changes, known errors and previous major incidents.

- Handled today across multiple channels and manual steps, so the experience is inconsistent.
- Information is often incomplete or delayed when a decision has to be made.
- Teams need clearer ownership, status visibility and timely escalation.

OBJECTIVE — BUSINESS NEED

HACKNOW CHALLENGE: Design the end-to-end business solution, user journey, process, roles, decisions, notifications, exceptions and measurable outcomes.

ELEMENTS TO INCLUDE IN DESIGN

- Major incident coordination workspace
- Capture incident impact, affected services, timeline and current status
- Provide a shared action and ownership view
- Record decisions, communications and recovery milestones
- Escalate unresolved critical actions
- Maintain stakeholder updates and closure summary
- Measure detection-to-recovery time, communication quality and recurring causes

HACKNOW DESIGN EXPECTATION

- Design the end-to-end business journey and user experience.
- Define the information, roles, decisions, approvals, actions and exceptions needed.
- Show how the process will be measured and how management will see outcomes.
- Participants decide the technology architecture and implementation approach.

IT INDUSTRY

BACKGROUND — PROBLEM

Service owners may know that a service repeatedly fails but spend significant time manually connecting incidents, problems, changes and work notes.

- Handled today across multiple channels and manual steps, so the experience is inconsistent.
- Information is often incomplete or delayed when a decision has to be made.
- Teams need clearer ownership, status visibility and timely escalation.

OBJECTIVE — BUSINESS NEED

HACKNOW CHALLENGE: Design the end-to-end business solution, user journey, process, roles, decisions, exceptions and measurable outcomes.

ELEMENTS TO INCLUDE IN DESIGN

- Service reliability investigation experience
- Bring together relevant operational history for a service issue
- Compare incidents, changes, problems and recurring symptoms
- Capture investigation hypotheses and evidence
- Track root cause and improvement actions
- Identify unresolved recurring patterns
- Measure recurrence, investigation effort and reliability improvement
- Perform Preventive Action & Remediation

HACKNOW DESIGN EXPECTATION

- Design the end-to-end business journey and user experience.
- Define the information, roles, decisions, approvals, actions and exceptions needed.
- Show how the process will be measured and how management will see outcomes.
- Participants decide the technology architecture and implementation approach.

IT INDUSTRY

BACKGROUND — PROBLEM

Resolved incidents contain valuable troubleshooting information, but knowledge creation is often manual and inconsistent.

- Handled today across multiple channels and manual steps, so the experience is inconsistent.
- Information is often incomplete or delayed when a decision has to be made.
- Teams need clearer ownership, status visibility and timely escalation.

OBJECTIVE — BUSINESS NEED

HACKNOW CHALLENGE: Design the end-to-end business solution, user journey, process, roles, decisions, exceptions and measurable outcomes.

ELEMENTS TO INCLUDE IN DESIGN

- Incident-to-knowledge creation journey
- Identify resolved incidents suitable for reusable guidance
- Capture problem, symptoms, resolution and applicability
- Review and validate proposed knowledge
- Publish clear user/agent guidance with ownership
- Measure usage and feedback
- Track repeat incidents reduced through knowledge reuse
- Track Article quality Score

HACKNOW DESIGN EXPECTATION

- Design the end-to-end business journey and user experience.
- Define the information, roles, decisions, approvals, actions and exceptions needed.
- Show how the process will be measured and how management will see outcomes.
- Participants decide the technology architecture and implementation approach.

IT INDUSTRY

BACKGROUND — PROBLEM

Application owners need a consolidated view of applications that are accumulating incidents, changes, problems and support effort.

- Handled today across multiple channels and manual steps, so the experience is inconsistent.
- Information is often incomplete or delayed when a decision has to be made.
- Teams need clearer ownership, status visibility and timely escalation.

OBJECTIVE — BUSINESS NEED

HACKNOW CHALLENGE: Design the end-to-end business solution, user journey, process, roles, decisions, exceptions and measurable outcomes.

ELEMENTS TO INCLUDE IN DESIGN

- Application operational-risk assessment
- Capture application ownership, business criticality and support indicators
- Assess operational risk consistently
- Identify applications with recurring incidents or high support demand
- Record improvement recommendations and priorities
- Provide leadership comparison across applications
- Measure risk reduction, incident trends and improvement progress

HACKNOW DESIGN EXPECTATION

- Design the end-to-end business journey and user experience.
- Define the information, roles, decisions, approvals, actions and exceptions needed.
- Show how the process will be measured and how management will see outcomes.
- Participants decide the technology architecture and implementation approach.

IT INDUSTRY

BACKGROUND — PROBLEM

Emergency admin access (“break-glass”) during outages is handled informally, leaving unresolved elevated privileges active long after incidents resolve.

- Handled today across multiple channels and manual steps, so the experience is inconsistent.
- Information is often incomplete or delayed when a decision has to be made.
- Teams need clearer ownership, status visibility and timely escalation.

OBJECTIVE — BUSINESS NEED

HACKNOW CHALLENGE: Design the end-to-end business solution, user journey, process, roles, decisions, exceptions and measurable outcomes.

ELEMENTS TO INCLUDE IN DESIGN

- Central Emergency Privilege Request Desk: Single-pane portal for requesting time-bound break-glass access with mandatory justification.
- Risk-Based Approval & Emergency Bypass Engine: Automates risk-based approval for major incidents with instant notifications to SecOps.
- Time-Bound Dynamic Access Timer: Automated countdown timer ensuring temporary elevated rights with auto-revocation upon expiration.
- Session Activity & Command Audit Logger: Immutable audit trail logging all actions and system changes performed during elevated access sessions.
- Orphaned Access & Access Review Detector: Visual indicator flagging expired or revoked privileged roles across system accounts.
- Security Compliance & Governance Analytics: Measure emergency access request frequency, time-to-revoke compliance, and audit pass rates.

HACKNOW DESIGN EXPECTATION

- Design the end-to-end business journey and user experience.
- Define the information, roles, decisions, approvals, actions and exceptions needed.
- Show how the process will be measured and how management will see outcomes.
- Participants decide the technology architecture and implementation approach.

HIRING / ONBOARDING / OFFBOARDING

BACKGROUND — PROBLEM

New hires may arrive without complete equipment, access, workspace, training or manager activities, creating a poor Day-1 experience.

- Handled today across multiple channels and manual steps, so the experience is inconsistent.
- Information is often incomplete or delayed when a decision has to be made.
- Teams need clearer ownership, status visibility and timely escalation.

OBJECTIVE — BUSINESS NEED

HACKNOW CHALLENGE: Design the end-to-end business solution, user journey, process, roles, decisions, exceptions and measurable outcomes.

ELEMENTS TO INCLUDE IN DESIGN

- New-hire readiness journey
- Provide employee and manager view of onboarding progress
- Track equipment, access, workspace, training and manager actions
- Identify dependencies and blockers before Day 1
- Escalate overdue critical activities
- Provide Day-1 readiness confirmation
- Measure readiness rate, blocker aging and onboarding experience

HACKNOW DESIGN EXPECTATION

- Design the end-to-end business journey and user experience.
- Define the information, roles, decisions, approvals, actions and exceptions needed.
- Show how the process will be measured and how management will see outcomes.
- Participants decide the technology architecture and implementation approach.

HIRING / ONBOARDING / OFFBOARDING

BACKGROUND — PROBLEM

Recruiters coordinate interview stages, feedback, approvals and offer decisions, with missing feedback often delaying hiring.

- Handled today across multiple channels and manual steps, so the experience is inconsistent.
- Information is often incomplete or delayed when a decision has to be made.
- Teams need clearer ownership, status visibility and timely escalation.

OBJECTIVE — BUSINESS NEED

HACKNOW CHALLENGE: Design the end-to-end business solution, user journey, process, roles, decisions, exceptions and measurable outcomes.

ELEMENTS TO INCLUDE IN DESIGN

- Candidate interview and decision journey
- Capture interview schedule, competencies and evaluator responsibilities
- Standardize structured feedback
- Identify missing or conflicting feedback
- Support review and decision checkpoints
- Communicate next steps and outcomes consistently
- Measure feedback completion, time-to-decision and conversion

HACKNOW DESIGN EXPECTATION

- Design the end-to-end business journey and user experience.
- Define the information, roles, decisions, approvals, actions and exceptions needed.
- Show how the process will be measured and how management will see outcomes.
- Participants decide the technology architecture and implementation approach.

HIRING / ONBOARDING / OFFBOARDING

BACKGROUND — PROBLEM

Employee exits can create business continuity risks when critical assets, privileged responsibilities, pending work or knowledge-transfer activities are missed.

- Handled today across multiple channels and manual steps, so the experience is inconsistent.
- Information is often incomplete or delayed when a decision has to be made.
- Teams need clearer ownership, status visibility and timely escalation.

OBJECTIVE — BUSINESS NEED

HACKNOW CHALLENGE: Design the end-to-end business solution, user journey, process, roles, decisions, exceptions and measurable outcomes.

ELEMENTS TO INCLUDE IN DESIGN

- Employee exit readiness journey
- Capture exit date, role, responsibilities, assets and critical work
- Identify knowledge-transfer and business-continuity risks
- Assign transition activities and owners
- Track handover, asset return and final approvals
- Escalate unresolved critical dependencies
- Measure exit readiness, handover completion and continuity risks

HACKNOW DESIGN EXPECTATION

- Design the end-to-end business journey and user experience.
- Define the information, roles, decisions, approvals, actions and exceptions needed.
- Show how the process will be measured and how management will see outcomes.
- Participants decide the technology architecture and implementation approach.

HIRING / ONBOARDING / OFFBOARDING

BACKGROUND — PROBLEM

Employees frequently struggle to interpret long HR policies and find the exact eligibility, documentation or approval requirements they need.

- Handled today across multiple channels and manual steps, so the experience is inconsistent.
- Information is often incomplete or delayed when a decision has to be made.
- Teams need clearer ownership, status visibility and timely escalation.

OBJECTIVE — BUSINESS NEED

HACKNOW CHALLENGE: Design the end-to-end business solution, user journey, process, roles, decisions, exceptions and measurable outcomes.

ELEMENTS TO INCLUDE IN DESIGN

- Employee-facing policy question journey
- Provide simple access to approved policy information
- Allow employees to ask questions in natural language
- Present concise answers with links to authoritative policy content
- Identify ambiguous or unanswered questions for HR review
- Maintain feedback and content improvement loop
- Measure self-service success and recurring HR enquiries

HACKNOW DESIGN EXPECTATION

- Design the end-to-end business journey and user experience.
- Define the information, roles, decisions, approvals, actions and exceptions needed.
- Show how the process will be measured and how management will see outcomes.
- Participants decide the technology architecture and implementation approach.

TRANSPORTATION & LOGISTICS

BACKGROUND — PROBLEM

Shipment delays and exceptions require operators to assess stage, impact, customer commitments and corrective action quickly.

- Handled today across multiple channels and manual steps, so the experience is inconsistent.
- Information is often incomplete or delayed when a decision has to be made.
- Teams need clearer ownership, status visibility and timely escalation.

OBJECTIVE — BUSINESS NEED

HACKNOW CHALLENGE: Design the end-to-end business solution, user journey, process, roles, decisions, exceptions and measurable outcomes.

ELEMENTS TO INCLUDE IN DESIGN

- Shipment exception management journey
- Capture shipment, exception type, location, impact and customer commitment
- Classify exceptions by urgency and business impact
- Assign corrective actions and accountable teams
- Escalate shipments at risk of customer commitments
- Provide customer/operations status visibility
- Measure resolution time, aging and exception recurrence

HACKNOW DESIGN EXPECTATION

- Design the end-to-end business journey and user experience.
- Define the information, roles, decisions, approvals, actions and exceptions needed.
- Show how the process will be measured and how management will see outcomes.
- Participants decide the technology architecture and implementation approach.

TRANSPORTATION & LOGISTICS

BACKGROUND — PROBLEM

Drivers may need to report accidents, vehicle breakdowns, cargo damage or safety events from a mobile device while under time pressure.

- Handled today across multiple channels and manual steps, so the experience is inconsistent.
- Information is often incomplete or delayed when a decision has to be made.
- Teams need clearer ownership, status visibility and timely escalation.

OBJECTIVE — BUSINESS NEED

HACKNOW CHALLENGE: Design the end-to-end business solution, user journey, process, roles, decisions, exceptions and measurable outcomes.

ELEMENTS TO INCLUDE IN DESIGN

- Driver incident reporting journey
- Provide a safe, simple mobile-friendly incident report
- Capture location, vehicle, people, cargo, severity and immediate actions
- Differentiate safety-critical events from routine incidents
- Coordinate follow-up across operations and safety
- Track evidence, investigation and corrective actions
- Measure response time, incident recurrence and safety trends

HACKNOW DESIGN EXPECTATION

- Design the end-to-end business journey and user experience.
- Define the information, roles, decisions, approvals, actions and exceptions needed.
- Show how the process will be measured and how management will see outcomes.
- Participants decide the technology architecture and implementation approach.

TRANSPORTATION & LOGISTICS

BACKGROUND — PROBLEM

Warehouse teams handle missing, damaged or incorrect packages and loading delays, but inconsistent classification slows resolution.

- Handled today across multiple channels and manual steps, so the experience is inconsistent.
- Information is often incomplete or delayed when a decision has to be made.
- Teams need clearer ownership, status visibility and timely escalation.

OBJECTIVE — BUSINESS NEED

HACKNOW CHALLENGE: Design the end-to-end business solution, user journey, process, roles, decisions, exceptions and measurable outcomes.

ELEMENTS TO INCLUDE IN DESIGN

- Warehouse exception capture and resolution journey
- Capture package, location, exception type and evidence
- Classify and route exceptions consistently
- Track investigation, correction and movement status
- Escalate aging or high-impact exceptions
- Identify recurring warehouse causes
- Measure exception volume, resolution time and recurrence

HACKNOW DESIGN EXPECTATION

- Design the end-to-end business journey and user experience.
- Define the information, roles, decisions, approvals, actions and exceptions needed.
- Show how the process will be measured and how management will see outcomes.
- Participants decide the technology architecture and implementation approach.

TRANSPORTATION & LOGISTICS

BACKGROUND — PROBLEM

Operators review manifests, delivery paperwork, invoices and proof-of-delivery documents manually, increasing the chance of missing information.

- Handled today across multiple channels and manual steps, so the experience is inconsistent.
- Information is often incomplete or delayed when a decision has to be made.
- Teams need clearer ownership, status visibility and timely escalation.

OBJECTIVE — BUSINESS NEED

HACKNOW CHALLENGE: Design the end-to-end business solution, user journey, process, roles, decisions, exceptions and measurable outcomes.

ELEMENTS TO INCLUDE IN DESIGN

- Document verification journey for logistics operations
- Capture or submit relevant shipment documents
- Check for missing, inconsistent or critical information
- Flag exceptions for human review
- Record verification decisions and supporting evidence
- Track resolution of document exceptions
- Measure processing time, exception rate and downstream delays

HACKNOW DESIGN EXPECTATION

- Design the end-to-end business journey and user experience.
- Define the information, roles, decisions, approvals, actions and exceptions needed.
- Show how the process will be measured and how management will see outcomes.
- Participants decide the technology architecture and implementation approach.

TRANSPORTATION & LOGISTICS

BACKGROUND — PROBLEM

Transport vehicles enter and leave manufacturing yards for material scheduling, loading and production support. Manual coordination creates bottlenecks, long queues inside and outside the facility, extended truck turnaround and higher carrier detention fees.

- Handled today across multiple channels and manual steps, so the experience is inconsistent.
- Information is often incomplete or delayed when a decision has to be made.
- Teams need clearer ownership, status visibility and timely escalation.

OBJECTIVE — BUSINESS NEED

HACKNOW CHALLENGE: Design the end-to-end business solution to monitor the vehicle journey inside and outside the facility—including processes, roles, decisions, exceptions and measurable outcomes.

ELEMENTS TO INCLUDE IN DESIGN

- Vehicle gate queue management journey
- Vehicle registration and queue entry
- Document validation and slot allocation
- Driver guidance to the assigned parking yard or loading dock
- Factory loading / unloading and automated paperwork
- Exit automation using a digital gate pass
- Vehicle turnaround time recorded from entry to exit
- Dwell time, detention cost and bottleneck analytics

HACKNOW DESIGN EXPECTATION

- Design the end-to-end business journey and user experience.
- Define the information, roles, decisions, approvals, actions and exceptions needed.
- Show how the process will be measured and how management will see outcomes.
- Participants decide the technology architecture and implementation approach.

RENEWABLE ENERGY & UTILITIES

BACKGROUND — PROBLEM

Renewable energy operators manage thousands of solar inverters, wind turbines, batteries and other assets. Operations teams often investigate alarms and equipment failures manually using incident history, maintenance records and technical documents, resulting in delayed diagnosis and unplanned downtime.

- Handled today across multiple channels and manual steps, so the experience is inconsistent.
- Information is often incomplete or delayed when a decision has to be made.
- Teams need clearer ownership, status visibility and timely escalation.

OBJECTIVE — BUSINESS NEED

Use AI to analyse asset failures, identify probable root causes, recommend corrective actions and automatically initiate the appropriate maintenance workflow.

ELEMENTS TO INCLUDE IN DESIGN

- Asset failure investigation workspace
- Unified asset, alarm, incident and maintenance history
- Automated evidence collection from records and technical documents
- Probable root-cause analysis with confidence and supporting evidence
- Corrective-action recommendations and guided troubleshooting
- Human review for safety-critical diagnoses and actions
- Automatic maintenance request and work-order initiation
- Criticality-based prioritization and escalation
- Failure patterns, diagnosis time and downtime analytics

HACKNOW DESIGN EXPECTATION

- Design the end-to-end business journey and user experience.
- Define the information, roles, decisions, approvals, actions and exceptions needed.
- Show how the process will be measured and how management will see outcomes.
- Participants decide the technology architecture and implementation approach.

RENEWABLE ENERGY & UTILITIES

BACKGROUND — PROBLEM

Once a renewable asset failure is diagnosed, maintenance work is still planned and dispatched manually across solar, wind and battery sites. Work orders, spares, field crews and site access are coordinated over calls and spreadsheets, so critical assets are not always prioritized, and performance losses go unmeasured.

- Handled today across multiple channels and manual steps, so the experience is inconsistent.
- Information is often incomplete or delayed when a decision has to be made.
- Teams need clearer ownership, status visibility and timely escalation.

OBJECTIVE — BUSINESS NEED

Automate the maintenance workflow end to end — prioritise by asset criticality, dispatch the right crew and parts, and give management a live view of downtime, response and generation impact.

ELEMENTS TO INCLUDE IN DESIGN

- Maintenance request and work-order journey
- Asset criticality and priority scoring model
- Automated routing to the right field crew and site
- Spares, tooling and site-access readiness checks
- Safety permits and compliance approvals in the flow
- Escalation for aging or high-impact outages
- Field closure evidence and asset history capture
- Preventive maintenance scheduling from failure trends
- Downtime, response time and generation-loss analytics

HACKNOW DESIGN EXPECTATION

- Design the end-to-end business journey and user experience.
- Define the information, roles, decisions, approvals, actions and exceptions needed.
- Show how the process will be measured and how management will see outcomes.
- Participants decide the technology architecture and implementation approach.

BANKING

BACKGROUND — PROBLEM

Customers raise requests such as failed transactions, card issues, account access, suspicious transactions, loan queries, payment disputes and address or contact updates. Today every request is routed to a generic banking support queue regardless of intent, urgency or the team best placed to resolve it.

- Triage and routing are manual, so simple requests wait behind complex ones.
- Customer and account details are often re-verified late in the process.
- Customers get inconsistent updates and limited visibility on resolution timelines.

OBJECTIVE — BUSINESS NEED

Create one banking service front door with multiple intelligent journeys — AI understands the customer's intent, recommends knowledge, validates information and drives the request through the right team, workflow, SLA and resolution path.

ELEMENTS TO INCLUDE IN DESIGN

- Customer mobile / online banking portal as front door
- Banking Operations Workspace for service teams
- AI-guided request capture, intent & priority classification
- Knowledge recommendation for self-service deflection
- Automated validation of customer and account information
- Intelligent routing to the right banking operations team
- Banking operations task with SLA monitoring and escalation
- CSM, Knowledge, Workflow and App Engine capabilities
- Resolution, customer notification and feedback capture

HACKNOW DESIGN EXPECTATION

- Design the end-to-end business journey and user experience.
- Define the information, roles, decisions, approvals, actions and exceptions needed.
- Show how the process will be measured and how management will see outcomes.
- Participants decide the technology architecture and implementation approach.

BANKING

BACKGROUND — PROBLEM

Customers report unauthorised transactions, duplicate charges, cash withdrawal issues and payment failures through multiple channels. Cases are often routed manually, making it difficult to distinguish urgent fraud from routine disputes.

- Fraud and dispute triage is manual, causing delays in high-risk cases.
- Customer, account and transaction details are repeatedly requested or validated.
- Customers have limited visibility of investigation status and expected resolution.

OBJECTIVE — BUSINESS NEED

Create a single intelligent journey for fraud alerts and transaction disputes. AI should understand the customer's intent, assess urgency, validate available information, recommend next steps and orchestrate the case through the right fraud, card or banking operations team with clear SLA and customer updates.

ELEMENTS TO INCLUDE IN DESIGN

- Customer mobile / online banking portal as the front door
- Single working view for fraud & dispute handling teams
- Guided case capture with intent, risk and priority classification
- Surfacing of relevant policy and resolution guidance to the handler
- Automated validation of customer, account and transaction information
- Rule-based routing to fraud, cards or banking operations teams
- Case and task workflow with SLA monitoring, escalation and approvals
- Duplicate / recurring dispute detection and investigation history
- Customer notifications, status visibility and feedback capture
- Reporting on case volumes, ageing, recovery and resolution outcomes

HACKNOW DESIGN EXPECTATION

- Design the end-to-end customer journey for fraud/dispute intake, triage, investigation and closure.
- Define the information, roles, decisions, approvals, actions and exceptions needed.
- Show how AI, workflow and automation reduce manual effort while protecting customer experience.
- Show how SLAs, operational dashboards and KPIs will measure outcomes for management.
- Solution must be realistically demonstrable and implementable within the 2-week HackNow timeframe.
